Coupons & Invoicing for Your Store

BUSINESS GUIDE

User Guide — Coupons & Invoicing for Your Store

A practical guide for running the coupon and invoicing features from your admin dashboard. No technical knowledge needed. Written for a store owner / manager.

Part 1 — Coupons

1.1 What coupons do

Coupons are discount codes your customers type in (or tap) at checkout to get money off — for example **WELCOME10** for 10% off. You create and control them from **Admin** → **Coupons**.

You decide: - the **code** customers use, - whether it's a **percentage** (e.g. 10% off) or a **flat amount** (e.g. ₹200 off), - a **minimum order value** before it can be used, - an **expiry date**, - how many times it can be used in total, - and whether it's currently **active**.

1.2 Creating a coupon (step by step)

1. Go to **Admin** → **Coupons**.
2. In the **Create coupon** form, fill in:
3. **Code** — what customers type, e.g. **FESTIVE20**. It's automatically uppercased.
4. **Discount type** — *Percent (%)* or *Flat amount*.
5. **Value** — **20** means 20% (percent) or ₹20 (flat).
6. **Min. order value** — e.g. **999** means the cart must be at least ₹999. Use **0** for no minimum.
7. **Expires on** — the last day the coupon works.
8. **Usage limit** — total number of times it can be redeemed. Use **0** for **unlimited**.
9. **Active** — tick to make it live immediately.
10. Click **Create coupon**. It appears in the list below.

1.3 Managing existing coupons

In the coupon list you can see, at a glance, each coupon's discount, minimum order, **usage** (e.g. **12 / 100** used, or **12 / ∞** for unlimited), expiry, and a status pill:

- **Active** (green) — live and usable.
- **Inactive** (grey) — switched off.
- **Expired** (red) — past its date.
- **Used up** (orange) — hit its usage limit.

Actions: - **Click the status pill** to quickly turn a coupon on/off. - **Pencil icon** — edit any detail, then **Save changes**. - **Trash icon** — delete it permanently.

1.4 What your customers see

At checkout, customers can: - **Type a code** into the coupon box and press **Apply**. - **See "Available offers"** — your active coupons shown as tappable chips. One tap applies the code. If their cart is below a coupon's minimum, it shows "Add ₹X more to use" and stays disabled until they qualify.

Trying a code is free — customers can apply and remove codes without "using them up". A coupon only counts as used once an order is actually **placed** (for online payments, once payment succeeds).

1.5 Demo: a "first order" welcome offer

Goal: give new shoppers 10% off orders over ₹500, capped at the first 500 uses.

1. **Admin** → **Coupons** → **Create coupon**:
2. Code: **WELCOME10**
3. Discount type: **Percent (%)**, Value: **10**
4. Min. order value: **500**
5. Expires on: (say) 3 months out

6. Usage limit: **500**
7. Active:
8. **Save.** Now:
9. A shopper with a ₹1,200 cart applies **WELCOME10** → gets ₹120 off.
10. A shopper with a ₹300 cart sees "Add ₹200 more to use".
11. After 500 redemptions, the coupon shows **Used up** and stops working.
12. When it passes its date, it shows **Expired**.

1.6 Demo: a flat festive discount

Goal: ₹200 off any order during a sale, unlimited uses, for two weeks.

- Code: **FESTIVE200**, type **Flat amount**, Value **200**, Min. order value **0**, Usage limit **0** (unlimited), Expiry two weeks out, Active
- A ₹150 cart applying it gets ₹150 off (a flat discount never exceeds the cart total). A ₹2,000 cart gets ₹200 off.

1.7 Coupon tips

- **Turn off instead of delete** if you might reuse a campaign — toggle it Inactive and back on later.
 - **Usage limit 0 = unlimited.** Set a real number for limited promos.
 - **Minimum order value** is the lever for protecting margins on percentage codes.
 - Percent codes are capped at 100%. Flat codes can't discount below ₹0.
-

Part 2 — Invoicing (GST Tax Invoices)

2.1 What the invoicing system does

For every order, your store generates a proper **GST tax invoice** as a PDF. It is: - **emailed to the customer** with their order confirmation, and - **downloadable** by the customer from their order page, and by you from the admin.

The invoice includes your business and GST details, the customer's billing/shipping details, each product with HSN code and tax, the CGST/SGST or IGST breakup, delivery charges, discounts, the grand total, and the amount in words — everything a real e-commerce invoice needs.

2.2 One-time setup (do this first!)

Go to **Admin** → **Invoicing** and fill in your details across the tabs. Until you do, invoices will print with a blank business section.

Tab: Seller & GSTIN

Your legal business identity — printed as the supplier on every invoice. Fill in: - **Legal name** (as registered) and **Trade name** (your brand). - Full **address, city, state, PIN code**. - **State code** — the **2-digit GST state code** (e.g. **06** Haryana, **27** Maharashtra, **07** Delhi). *This is the most important field* — see below. - **GSTIN** (15 characters), **PAN**, and **CIN** if you have one. - Contact **email, phone, website**.

Why the state code matters: GST is split based on where you and your customer are. - Customer in the **same state** as you → the tax shows as **CGST + SGST**. - Customer in a **different state** → the tax shows as **IGST**.

If you leave the state code blank, every invoice safely defaults to CGST + SGST.

Tab: Tax

- **Charge GST** — turn off only if you don't bill GST at all (removes tax columns).
- **Default GST rate (%)** — e.g. **18**. Applied to every product.
- **Default HSN / SAC code** — the tax classification code for your products.
- **Product prices already include GST** — **leave this ON** (recommended). Your checkout total doesn't add tax on top, so with this on, the invoice total matches exactly what you charged. (If you turn it off, tax is *added on top* and the invoice total will be higher than what the customer paid — the screen warns you about this.)
- **Shipping HSN / rate** — tax treatment for delivery charges (default **996812**, 18%).
- **Round the grand total** — rounds to the nearest rupee and shows a round-off line.

Tab: Numbering

Controls what your invoice numbers look like: - **Prefix** — e.g. **INV**. - **Digits** — **5** produces **00042**. - **Next number** — the next sequence to use. *You can raise this to continue from a previous system, but it can't be lowered* (reusing an invoice number isn't allowed). - **Include financial year** — adds the Indian FY, e.g. **INV/2026-27/00042**. - **Restart each financial year** — standard practice; numbering resets to 1 each April.

A live preview shows exactly how the next number will look.

Tab: Document

The wording printed on the invoice: **title** (e.g. TAX INVOICE), **declaration, terms & conditions, notes, footer**, and **signature label**. Toggles let you show/hide the **amount in words**, the **HSN/SAC tax summary**, and **bank details**. There's also the switch to **attach the invoice PDF to the order email**.

Tab: Bank

Your account details (only printed if "Show bank details" is on in the Document tab).

When done, click **Save changes**.

2.3 Day-to-day: nothing to do

Once set up, invoicing is automatic. When an order is placed (or paid, for online payments), the invoice is created, numbered, emailed to the customer, and stored.

2.4 Finding and downloading invoices

- **Customers** download theirs from **My Account** → **Orders** → **(an order)** → **Download Invoice**, and receive it by email.
- **You (admin)** have two places:
- **Admin** → **Orders** — each order has an **Invoice** link.
- **Admin** → **Invoicing** → **Invoice Register** — a searchable list of every invoice with **totals for invoiced value and tax collected** (handy for GST filing). Search by invoice number or customer, and view/download any invoice.

2.5 Demo: your first live invoice

1. Complete the **Seller & GSTIN** tab, making sure **State code** is set (e.g. **06**), and set **Default GST rate** to **18** on the Tax tab.
2. Place a test order in the store (or have a customer place one).
3. Check the confirmation email — the invoice PDF is attached.
4. Open **Admin** → **Invoicing** → **Invoice Register** — the invoice is listed, tagged **(CGST+SGST)** if the customer is in your state or **(IGST)** if not.
5. Click **view** to see the finished document: your business at the top, the customer's details, itemised products with tax, the totals with the correct tax split, amount in words, and the HSN summary.

2.6 Reading a tax invoice (what each part means)

- **CGST + SGST** — shown when the customer is in your state; the GST is split into two equal halves.
- **IGST** — shown when the customer is in a different state; a single combined tax.
- **Taxable Value** — the price before tax (tax is worked out from this).
- **HSN/SAC Summary** — a small table grouping tax by product classification and rate; required for GST returns.
- **Round Off** — a few paise added/removed so the total is a whole rupee.
- **Amount in Words** — the grand total spelled out, as required on invoices.

2.7 Important settings to get right

- **State code** decides CGST+SGST vs IGST — set it correctly.
- Keep **"prices include GST"** **ON** unless your catalogue prices genuinely exclude tax, so invoice totals match what customers actually paid.
- **Invoice numbering** should be continuous — don't lower the next number.
- Fill in **GSTIN/PAN** accurately; they're printed as your legal identity.

2.8 Frequently asked questions

Do I need to generate invoices manually? No. They're created automatically when an order is confirmed.

Can I change an invoice after it's issued? No — invoices are locked once issued, as required for legal/tax records. If you change your GST rate or address later, past invoices keep their original details; only new invoices use the new settings.

A customer wants their invoice again — what do I do? They can re-download it any time from their order page, or you can open it from **Admin** → **Orders** or the **Invoice Register**.

We don't charge GST — can I still use this? Yes. On the **Tax** tab, turn **Charge GST** off. Invoices then print without tax columns.

Can different products have different GST rates? Not yet — currently one default rate applies to all products. Ask your developer; it's a supported future enhancement.

Both systems are managed entirely from your admin dashboard — Coupons under Admin → Coupons, and invoicing under Admin → Invoicing.
